

ABSTRACT

A sanding attachment, for use in conjunction with an existing reciprocating power tool, for sanding a rough 5 surface of an existing object. The sanding attachment comprises an elongated strip of metal having an attachment end for selective attachment to the power tool, and a sanding end for abrading and smoothing the rough surface of the existing object. The bottom surface of the sanding end has a 10 sanding strip comprised of a substantially rectangular, flat piece of metal having a plurality of raised protuberances capable of efficiently sanding an object. The sanding attachment has two bends, which results in the attachment end and the sanding end being substantially mutually 15 perpendicular to one another. After the sanding attachment has been selectively attached to the power tool, and the power tool is held within the hands of the user in the usual fashion, the sanding attachment is suitably positioned for efficiently sanding a substantially horizontal surface.
